

ABAS Feature demo

Defect quoting

1. Quotes are created from the iPad, or in the office via the website.

This screenshot shows a quote that has been created via the iPad and is now in the office queue for review:

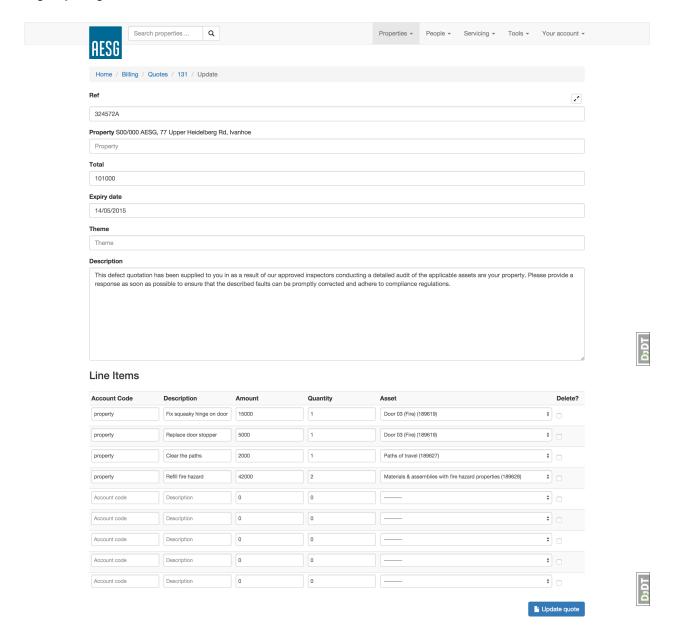

This quote can then be emailed to client, downloaded as a PDF, previewed or edited. The quote line item is attached to an asset, allowing a complete service, defect and repair history at the asset level.

2. Editing or creating a quote in the invoice is simple:

Attach custom defects or line items, and attach arbitrary products to each item on the asset registry, or general service line items like labour.

3. This is a quote that is being previewed:

The template engine on ABAS is simple HTML, allowing customers to customise their templates easily, engage third party designers to update their templates, or engage us to make any required customisations.

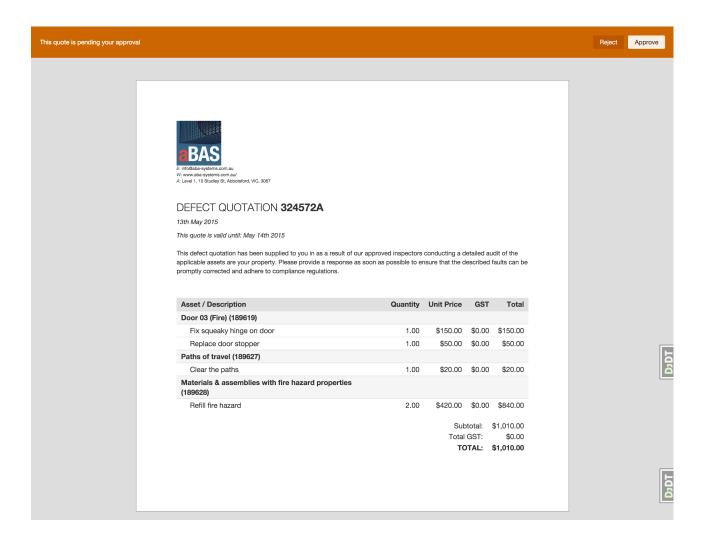

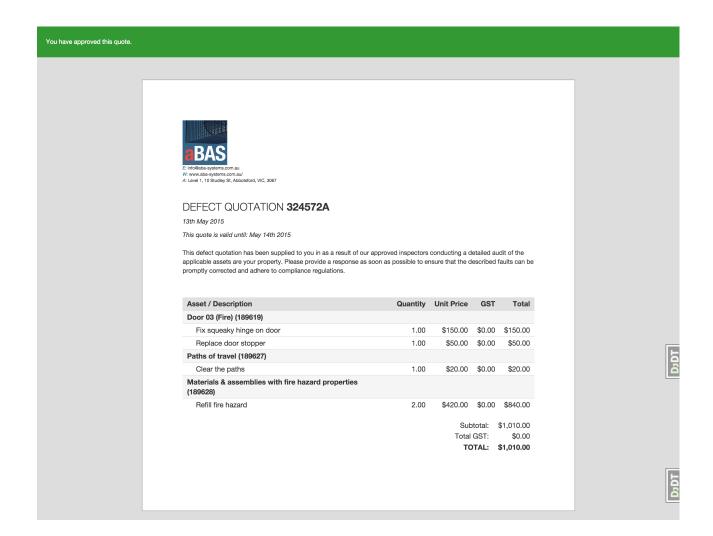

4. ABAS is about efficiency — quotes can be sent directly to the customer.

The quote can be sent directly to the customer. The customer receives an email, a PDF of the quote, and a web-form where they can approve the quote or reject it.

Approved quotes can be configured to come back to the office, or converted directly into a work order for the technician.

5. Approved quotes are archived and available for your customer via the link in the email forever, as well as accessible via their online portal to your ABAS system.
